Problem 1 (4/10, *A little group theory drill*):

Let G be a group with group operation $*$ and identity element e . Suppose that $\forall g \in G$ we have that $g * g = e$. Show that G is an abelian group.

Proof. We can know that,

$$\forall a, b, g \in G$$

We have

$$\begin{aligned} a * b \in G \text{ and } g * g^{-1} &= e \\ \rightarrow g &= g^{-1} \\ \rightarrow a * b &= (a * b)^{-1} \\ &= b^{-1} * a^{-1} \\ &= b * a \end{aligned}$$

Finally, we get that

$$a * b = b * a$$

So, G is an abelian group.

Done. □

Problem 2 (4/10, *Behavior of identity element and inverses under group homomorphisms*):

Let G, H be groups with group operations $*_G, *_H$ and identity elements e_G, e_H respectively. Let $\phi : G \rightarrow H$ be a group homomorphism. Show that $\phi(e_G) = e_H$ and that $\forall g \in G$ we have that $\phi(g^{-1}) = (\phi(g))^{-1}$.

Proof. First question.

Because $\phi : G \rightarrow H$ is a group homomorphism.

We can say that

$$\forall g \in G, \exists h \in H \quad \phi(g) = h$$

Then,

$$\begin{aligned}\phi(g) &= \phi(g *_{\mathcal{G}} e_{\mathcal{G}}) \\ &= \phi(g) *_{\mathcal{H}} \phi(e_{\mathcal{G}}) \\ &= h *_{\mathcal{H}} \phi(e_{\mathcal{G}}) \\ &= h\end{aligned}$$

So we have

$$h *_{\mathcal{H}} \phi(e_{\mathcal{G}}) = h$$

Then,

$$\begin{aligned}h^{-1} *_{\mathcal{H}} h *_{\mathcal{H}} \phi(e_{\mathcal{G}}) &= h^{-1} *_{\mathcal{H}} h \\ \forall h \in \mathcal{H} \quad h *_{\mathcal{H}} h^{-1} &= h^{-1} *_{\mathcal{H}} h = e_{\mathcal{H}}\end{aligned}$$

Finally,

$$\phi(e_{\mathcal{G}}) = e_{\mathcal{H}}$$

Second question.

We know

$$\phi(e_{\mathcal{G}}) = e_{\mathcal{H}}$$

and

$$\forall g \in \mathcal{G} \quad g * g^{-1} = e_{\mathcal{G}}$$

So,

$$\begin{aligned}\phi(e_{\mathcal{G}}) &= \phi(g *_{\mathcal{G}} g^{-1}) = \phi(g) *_{\mathcal{H}} \phi(g^{-1}) \\ &= e_{\mathcal{H}}\end{aligned}$$

We can do

$$\begin{aligned}(\phi(g))^{-1} *_{\mathcal{H}} \phi(g) *_{\mathcal{H}} \phi(g^{-1}) &= (\phi(g))^{-1} *_{\mathcal{H}} e_{\mathcal{H}} \\ \rightarrow (\phi(g))^{-1} &= \phi(g^{-1})\end{aligned}$$

Done. □

Problem 3 (2/10, *Group isomorphism is a transitive relation*):

Let G, H, K be groups such that G is isomorphic to H , and H is isomorphic to K . Show that G is isomorphic to K .

Proof. Show that:

Let: $\phi_G, \phi_H, \psi_H, \psi_K : G \rightarrow H, H \rightarrow K, H \rightarrow G, K \rightarrow H$ be group

homomorphism respectively.

$$\begin{aligned}
& \forall g \in G \quad \exists h \in H \quad \phi_G(g) = h \\
& \forall h \in H \quad \exists k \in K \quad \phi_H(h) = k \\
& \forall k \in K \quad \exists h \in H \quad \psi_K(k) = h \\
& \forall h \in H \quad \exists g \in G \quad \psi_H(h) = g \\
& \rightarrow \forall g \in G \quad \exists k \in K \quad \phi_H(\phi_G(g)) = k \\
& \& \quad \forall k \in K \quad \exists g \in G \quad \psi_H(\psi_K(k)) = g
\end{aligned}$$

So we can find a function ϕ let

$$\forall g \in G \quad \exists k \in K \quad \phi(g) = k$$

There also is a function ψ let

$$\forall k \in K \quad \exists g \in G \quad \psi(k) = g$$

So, G is isomorphic to K .

Done. □
